

**Phenology: one parameter the data informs, one it cannot**  
**d\_onset and d\_fall share the prior U(1, 365)**

**Same axis, rescaled: d\_fall lies on its prior**

*d\_fall is inert as transcribed (DECISIONS section 2, correction 2): it cannot affect the likelihood, so recovering its prior is the correct behaviour, not a failure to converge. Plumbing run: 2 chains, 200 tune, 200 draws, 1997-1998. Machinery check, NOT a posterior.*
